USE OF AUS-SPEC PUBLICATIONS

1. Greater Taree City Council grants a non-exclusive Licence to the end user for the use of Greater Taree City Council AUS-SPEC Specifications and hereafter referred to as “AUS-SPEC”.

2. AUS-SPEC will only be used for works where Greater Taree City Council is a Consent Authority for, or owner or operator or manager of, assets, or consultant to same.

3. No copying or modification of AUS-SPEC documents is permitted unless authorised by Greater Taree City Council in writing.

4. The end user shall be responsible for the correct application of AUS-SPEC. The end user acknowledges that Standards Australia, IPWEA and Greater Taree City Council have no control over and cannot influence the circumstances in which AUS-SPEC may be used by the end user and, accordingly, the end user agrees to indemnify and hold harmless Standards Australia, IPWEA and Greater Taree City Council against all actions, suits, proceedings, claims, demands, costs or losses whatsoever which may be brought, commenced or made against them, either jointly or separately, or which may be suffered by them or any of them in respect of the use of AUS-SPEC.

5. This License is personal and shall not be assigned, and the end user shall not allow any other person to use or have access to AUS-SPEC.

6. This Agreement shall be governed and construed in accordance with the laws of New South Wales.

7. These Licence conditions are deemed to have been accepted by the end user.

SITE REGRADING
Amendment Record for this Specification Part

This Specification is Council's edition of the AUS-SPEC generic specification part and includes Council's primary amendments.

Details are provided below outlining the clauses amended from the Council edition of this AUS-SPEC Specification Part. The clause numbering and context of each clause are preserved. New clauses are added towards the rear of the specification part as special requirement clauses. Project specific additional script is shown in the specification as italic font.

The amendment code indicated below is ‘A’ for additional script ‘M’ for modification to script and ‘O’ for omission of script. An additional code ‘P’ is included when the amendment is project specific.

DEVELOPMENT DESIGN SPECIFICATION D6 - SITE REGRADING

GENERAL

D6.01 SCOPE

1. This design specification sets out requirements for the site regrading involved in land development and subdivision. Conceptual requirements are presented as necessary considerations when preparing designs for site regrading.

2. The scope of this specification assumes that the Designer is familiar with requirements cited in the various construction specifications, specifically those related to earthworks, clearing and grubbing, erosion and sedimentation. Additionally the Designer needs to make reference to the associated design specifications related to drainage design, geometric road design and stormwater management and erosion design.

D6.02 OBJECTIVES

1. This specification aims to assist the Designer in achieving:

   • efficient and economical design
   • enhancement of the environmental character of the site whilst maintaining the natural features of the site
   • provision of safe conditions for construction commensurate with the proposed purpose of the development
   • equality of building conditions for residential development
   • a minimal impact on adjoining properties and developments.

D6.03 REFERENCE AND SOURCE DOCUMENTS

(a) Council Specifications

   Construction Specifications
   C211 - Control of Erosion and Sedimentation
   C212 - Clearing and Grubbing
   C213 - Earthworks

   Design Specifications
   D1 - Geometric Road Design
   D5 - Stormwater Drain Design
   D7 - Stormwater Management and Erosion Design

(b) Australian Standards

   AS 3798 - Guidelines on earthworks for commercial and residential developments
   AS 2870.1 - Residential slabs and footings - Construction.
   As 1289 - Methods of testing soils for engineering purposes
D6.04 SITE REGRADING CONCEPT

1. Areas of a site proposed for building or recreational purposes may not be suitable in their natural state for their intended function without improvement works to:

   (a) Alleviate flooding of low-lying ground
   (b) Fill gullies or create emergency flowpaths after underground stormwater piping has been installed
   (c) Allow improved runoff from flat ground
   (d) Regrade excessively steep slopes that would preclude economical construction of dwelling foundations
   (e) Allow effective recreational use or give reasonable access

   The Consultant shall review the natural surface contours and where necessary shall design finished surface levels that ensure the land is suitably prepared

2. Where practical, areas should be regraded to minimise the necessity for underground drainage systems with surface inlet pits, and allow surface water to flow naturally to roads or drainage reserves without excessive concentration.  

3. The Consultant shall consider the implications of site regrading in relation to the existing natural environment. Generally site regrading shall be minimised in heavily treed areas and shall conform to all development approvals/licences issued under relevant Acts.

4. Care shall be taken to provide depressions for overland flow from low points and over major drainage lines, to direct stormwater for storms up to a 100 year average recurrence interval.

5. The design of site regrading areas in conjunction with the design of roadworks shall be considered with the objective of balancing cut to fill and achieving both an economical development and minimising haulage of imported fill or spoil to and from the development site. Bulk haulage should always be considered an adverse effect on adjacent development and infrastructure.

6. The existing natural topsoil of an area to be regraded shall be removed and stockpiled for replacement as the surface layer in accordance with the terms of the specification.

D6.05 SPECIAL TREATMENT OF PARTICULAR AREAS

1. Areas abutting flooding or nuisance drainage sites shall be site regraded to a minimum level stipulated by Council above the 1% AEP Flood levels. The site shall be identified on the design plans with appropriate notation of site specific requirements.

   Where filling of lots is required (in whole or part) to raise the level of such lots above flood level, or so that such lots may be satisfactorily drained, the filling must have adequate strength and low compressibility if it is to be used for the support of road pavements and/or buildings.
2. In the event that an area is known to be affected by or inundated by local stormwater flows, the Designer shall investigate the existing conditions as they relate to the proposed development and advise the Developer in the preliminary design report on all data obtained in the investigation and recommend appropriate contour adjustments. The report should normally be accompanied by sketch plans to clarify recommendations.

3. Site constraints either natural or otherwise may be required to be identified as a burden on developed property. It is recommended that the designer take this into account when preparing the design. The property may ultimately be affected by a "restriction as to user", which may be controlled by a legal 88B Instrument placed on title to the land and/or by a Section 149 message advising prospective purchasers of any restrictions affecting the land.

4. The finished surface of filled areas shall be designed to levels allowing an adequate cover depth over the pipeline (if piped) and permitting surface stormwater flow to be guided to inlet pits if depressions are retained in the finished surface contouring.

5. The location of such features shall be clearly defined on the site regrading plans and defined by distance to corner boundaries, monuments, etc for purposes of relocation at the geotechnical testing stage for work-as-executed plans. A geotechnical report specifying the site specific preparation and compaction requirements will be required to be incorporated with the site regrading plan. A description of the minimum acceptable quality of the fill shall also be specified on the plans, supported by geotechnical recommendations. All documentation necessary from various authorities to support the filling of dams and watercourses shall be supplied with the design plans.

6. The finished level of any building area shall be designed to ensure a desirable surface grading of 1.5% (1% minimum) oriented in the direction of the drainage system designed to cater for its catchment. Any filling or regrading shall be designed not to impound or concentrate surface water on adjoining property.

7. Building areas containing natural ground slopes of an excessively steep nature, ie greater than 15% shall be brought to the attention of a Geotechnical Engineer for investigation of compatibility with dwelling types proposed. Specific requirements shall be noted on the design plans.

8. All sites are to be assessed against the Acid Sulfate Soil Risk Maps prepared by the Soil Conservation Service of NSW (June 1995)

A management plan for acid sulfate soils must be prepared for all developments likely to disturb acid sulfate soils. A full description of the management procedures to be applied must provide a framework for the ongoing management and monitoring of the impacts of acid soil material throughout the construction and after completion of any development.

D6.06 GENERAL STANDARD OF LOT PREPARATION

1. Special requirements will apply where necessary but generally lots are to be cleared of low scrub, fallen timber, debris, stumps, large rocks and any trees which in the opinion of Council are approaching the end of their functional life or are dangerous or will be hazardous to normal use of the development. Such requirements shall be shown on the design plan.

2. All timber and other materials cleared from lots shall be removed from the site.
All roots, loose timber, etc which may contribute to drain blockage shall be removed. Such requirements shall be shown on the design plan.

3. In areas to be filled over butts of trees, allowance is to be made for clearing of all trees and replanting with advanced suitable species to each lot; planting to be clear of probable future building location, and not to be commenced until filling has been completed and graded, with provision for watering and maintenance for duration of the contract. These specific requirements shall be shown on the design plans.

4. Selected trees shall be preserved by approved means to prevent destruction normally caused by placement of conventional filling or other action within the tree drip zone.

D6.07 STANDARD OF FILL FOR LOTS

1. The following notations are to be incorporated in the design plans. "Filling is to be of sound clean material, reasonable standard and free from large rock, stumps, organic matter and other debris."

2. All filling works shall be carried out under the supervision and to the satisfaction of a qualified Geotechnical Engineer or Engineering Geologist. At the completion of works a report prepared by the Geotechnical Engineer or Engineering Geologist shall be submitted to Council determining the suitability of each allotment for residential development.

3. Fill comprising natural sands or industrial wastes or by-products will be accepted by Council only in approved locations and will be subject to specific requirements determined by prevailing conditions.

4. It is essential that prior advice be given of intended use of such materials. It should be noted that failure to obtain the Principal Certifier’s approval may lead to an order for removal of any material considered by the Principal Certifier or other relevant authorities as unsuitable or in any way unfit for filling.

5. All areas where filling has been placed are to be dressed with clean arable topsoil, fertilised and sown with suitable grasses. Top soil is to be spread to a depth of not less than 100 mm.

D6.08 TEMPORARY DIVERSION DRAINS

1. Where temporary drains are required to divert surface flows away from the site regrading area, the location and silt/erosion control treatment shall be clearly identified on the engineering plans. The scale of such works shall reflect the volume of water to be diverted.

The objective will be to ensure minimal soil disturbances and material loss off the site.
Control measures will include, but not be limited to:

(a) Provision of trench stops every 30m along a trench, with provision for overtopping to be directed to the kerb.
(b) Placement of "blue metal" bags along kerb and gutter at maximum 30m spacings.
(c) Placement of "blue metal" bags around downstream drainage pits.

The requirements identified in Council’s Specification D7 should be addressed for any additional requirements.

D6.09 CONCURRENCE WITH THE COUNCIL’S EROSION & SEDIMENT CONTROL POLICY, 1999

1. The Consultant is recommended to refer to Council’s policy with regard to any items requiring specific consideration when preparing a site regrading plan. Such plans may need to incorporate sediment/siltation/erosion control devices with specific reference to the stage at which these are to be provided. The responsibility shall rest with the consultant/developer to make enquiries with Council and subsequently obtain the Principal Certifier’s approval to proposed measures.

D6.10 WORK-AS-EXECUTED PLANS

1. The Consultant shall annotate on the site regrading plan, the site specific detail to be shown on the Work-as-Executed plans. Such detail shall include geotechnical report certifying the works to be suitable for the intended purpose and any other certifications, testing and survey data, as required in specifications.

D6.11 CARTAGE OF SOIL

1. The Consultant shall refer to Council for acceptable haul roads with applicable load limits. This detail shall be required to be shown on the site regrading plan. The payment of a Bond may be required by the developer/contractor where Council has some concern about the ability of a haul road to sustain the loads without undue damage or maintenance requirements.

2. Unless specific application is made to the Principal Certifier and approval obtained, the plans will be annotated as follows:

"All topsoil shall be retained on the development site and utilised effectively to encourage appropriate revegetation."

D6.12 PERMIT TO ENTER TO CONSTRUCT

1. Where it is proposed to undertake construction work on adjoining private property, a permit to enter shall be sought from the owner and submitted to the Principal Certifier prior to the commencement of construction. (refer also to D5 Clause D5.20)
